

# FLAXWOOD SOUTH

## WATER AND LAND PLAN

Philosophy to add more feed and less fertiliser artificial fertiliser.

### Implemented things

Spray truck to spray liquid urea to reduce urea use which we consider has grown significantly less than hoped. Less urea, less grass grown. Will have to revert back to granular application for more effective grass growth.

### Appendix O (b)

Northern southland has such extreme weather conditions.

Centre pivot irrigation to get smaller and more even applications of effluent as well as to combat the extreme dry periods we can have.

2 bad payout years removed grain and pke feed brought in supplement and had the worst two seasons this past season down 95,000kgms on best season plus this season had to buy in 700 bales supplement

### Rule 23

This winter we have grazed 400 cows on crop at home. The winter area we are using a small area of orange, this appears the best area for wintering as not pugging up.

Love to have a winter barn but can't afford to build one.

Report to be labour intensive increasing the cost of labour, wear and tear on machinery, more farm working expenses.

Run off block purchased to grow better stock. Will milk on again before consent expires.
